

Error Log Student Semester Average

Name: Rasheed Allaudin

Credit Name: CSE3010

Assignment name: StudentSemesterAverage GUI

Error Log Entry 1:

Error: Main method not found in class Mastery.StudentSemesterAverage, please define the main method as:

**public static void main(String[] args)
or a JavaFX application class must extend javafx.application.Application**

-When i tried to run the code, an error occurred which i displayed above

What Caused The Issue?

```
public static void main(String args) {
```

-The issue happened because args is not a single String but an array of Strings. In Java, arrays must be declared using brackets []. That's why String[] args requires the brackets.

How did you resolve the issue?

-I fixed the issue by declaring args correctly as an array of Strings using String[] args. This ensures Java recognizes it as the required String array for the main method.

```
public static void main(String[] args) {
```

Error Log Entry 2:

```
60 */  
61 private void initialize) {
```

-An error occurred on this line of code.

What Caused The Issue:

-I revised the code and realized that the problem came from having a closing parenthesis without a matching opening parenthesis in my method declaration. Because of that, Java couldn't interpret the method correctly and produced a syntax error.

How did you resolve the issue:

```
private void initialize() {
```

-I resolved the issue by adding the missing opening parenthesis so the method had a proper set of (). Once the parentheses were correctly paired, the method declaration became valid and the code compiled successfully.

Error Log Entry 3:

```

-When I fill out all the information and try to save to the file an error pops up on my screen which i have provided above.

What Caused The Issue?

```
String averageString = String.format("%.1f%", average);
```

-I revised over my code and realized that in this line of code i needed to percentage signs after the f. In Java, when using String.format("%.1f%", average), the two percent signs (%%) are needed because the % character has a special meaning in format strings: it signals the start of a format specifier (like %f for floating-point numbers). To actually display a literal percent sign (%) in the output, you must escape it by writing two percent signs (%%).

How Did you resolve the issue:

```
String averageString = String.format("%.1f%%", average);
```

-You resolved the issue by using two percent signs (%%) in the format string. In String.format, a single % is a special character used to indicate the start of a format specifier. To actually display a literal percent sign (%) in the output, you must escape it by using %%
